Semester: Spring(7th)

Department: CSE

Batch: 53

Section:7A

Seminar Topic: UI/UX Design and Industry Practice

Keynote speaker: Sabariya Muzumder

Date of Submission:16/05/2026

1. Introduction

This seminar was centered around the topic "UI/UX Design and Industry Practices." The seminar shed light on the significance of UI and UX design in contemporary software development and explained how visually appealing interfaces and user-friendly systems, combined with design thinking, lead to greater user satisfaction and improved business outcomes. Furthermore, the seminar provided insight into the current industry practices for this specialization.

2. Background of the Keynote Speaker

The seminar was delivered by Sabariya Muzumder, a Product and UI/UX Designer specializing in SaaS platforms and web applications, with over 15 projects successfully delivered throughout her career. Her professional expertise covers UX research, design systems, and user-centered interface design.

He currently holds the position of User Experience Designer at **Flyte Solutions Ltd.** in Gulshan, Dhaka, Bangladesh — a full-time, on-site role she has held since November 2023. Her responsibilities include product analysis and user research, among other UX-related disciplines. Prior to this, she worked as a Junior UI/UX Designer at **CRID USA** from April to October 2023, based in Dhaka, where she gained professional design experience in a client-facing environment.

Beyond her professional roles, Sabariya Muzumder also demonstrated leadership within the academic community through the **UITS Computer Club**. She progressed from Junior Executive (May 2020) to Vice President (July 2021) and subsequently served as Acting President for nearly a year. Through the presentation in the seminar, it was observed that the speaker shared her experience within the industry, the designing process, and the creation of products from the user's perspective.

3. Purpose and Goals of the Seminar

The main purposes of the seminar were:

- To introduce the fundamentals of UI and UX design.
- To explain the role of UI/UX designers in the software industry.
- To discuss current industry practices and workflows.
- To help students understand real-world product design challenges.
- To encourage students to develop creative and user-focused thinking.
- To provide career guidance related to UI/UX design.

4. Key Points and Discussions

The speaker noted that UI deals with the look of a product, whereas UX is concerned with the overall user experience. Although closely related, the two disciplines require different approaches and skillsets.

Teamwork within the UI/UX field was stressed as an important factor in building successful products. Designers must collaborate effectively with developers, product managers, and other stakeholders throughout the development process.

Career Possibilities:

Career Role	Focus Area
UI Designer	Designs the visual elements and interactive components of digital interfaces.
UX Researcher	Conducts user studies, interviews, and usability tests to inform design decisions.
Product Designer	Takes a holistic view covering both UI and UX across the full product lifecycle.
Interaction Designer	Focuses on defining the specific behaviours and animations during user interactions.

5. Knowledge and Skills Acquired

- The distinction between UI and UX.
- The necessity of conducting user research prior to designing.
- Knowledge of industry-standard design software tools.
- Insight into how real companies implement their design process.
- The significance of collaboration and communication during software development projects.
- Increased interest in creative problem-solving and user-oriented development.

6. Linking Academic Learning to Industry Practice

The seminar effectively illustrated how academic knowledge applies within an industry setting. At universities, students primarily learn about programming, software engineering, and theoretical concepts. However, the seminar highlighted the importance of:

- User satisfaction
- Product usability
- Design thinking
- Collaboration
- Practical problem-solving skills

The guest lecture demonstrated that companies employ practical processes involving deadlines, client feedback, and testing approaches — areas that may not be extensively covered at the academic level. The seminar therefore managed to bridge the gap between academia and industry practice by showing how the same software development concepts taught in classrooms are applied in a real, user-focused environment.

7. Recommendations for Improving Academic Programs

Based on the seminar discussions, academic programs could be improved through the following measures:

1. Introducing more UI/UX practical projects into the curriculum.
2. Incorporating industry-standard design tools into coursework.
3. Regularly conducting workshops and seminars with industry professionals.
4. Assigning more team-based projects to develop collaborative skills.
5. Creating internship programs within software firms.
6. Educating students on how to conduct user research and usability testing.
7. Revising program content regularly to keep pace with industry trends.

These improvements would enable students to become more employable in the software and design industries.

8. Conclusion

The seminar held on the topic "UI/UX Design and Industry Practices" was highly informative and educational. Students were given detailed insights into current design systems, industry demands, and professional workflows. The presentation helped students understand the significance of UI/UX design in the technology field and how it contributes to building better, more user-friendly software products.

9.Final Thoughts and Overall Significance

In summary, the seminar provided a valuable learning opportunity. It raised awareness of the significance of designing intuitive digital products and highlighted how UI/UX design drives both company growth and customer satisfaction. Through practical examples and expert knowledge shared by the speaker, the seminar proved to be engaging and motivating for all students enrolled in the program. It reinforced the understanding that good design is not merely an aesthetic concern — it is a critical component of successful software development.
