2026 World Friends Korea (WFK) IT Online Training Program

Submitted To

Farah Ulfat Zaima

Lecturer, University of Information Technology & Sciences (UITs)

Submitted By

Md. Shoyaif Rahman (0432310005101050)

Semester: Autumn 2026

Department: CSE

Batch: 53

Section: 8A

Date of Submission: 16/05/2026

1. Introduction

I have participated in 2026 World Friends Korea (WFK) IT Online Training Program from 13th July to 3rd August, 2026. WFK IT Online Training is an online international 3-week-long training and project-based learning program conducted by KAIST (Korea Advanced Institute of Science and Technology) in coordination with the Institutional Quality Assurance Cell (IQAC) of the University of Information Technology and Sciences (UITS) in cooperation with the National Information Society Agency (NIA) of South Korea. 72 students from UITS including me have participated in two batches in this program and received practical exposure to modern Information Technology topics including Python Programming, Artificial Intelligence, Machine Learning and AI-powered Software Development. This report is submitted as one cohesive report replacing the Seminar reports 4, 5, 6, 7 as per the weightage as the marks of WFK Online Program are equivalent to four seminar marks.

Given the practical training nature, this type of exposure is essential for any computer science and engineering students because it has brought an enormous real technology exposure beyond traditional book knowledge and link academia with the very hands on application driven through project mentoring by a globally acclaimed institution.

The WFK program was neither a regular class-based seminar nor its own distinct format. It was a continuous learning process where Technical Teaching & Learning, Exercises/Practice, Team Projects, AI-powered Development, Cultural Exchange, International Collaboration, Presentation and Evaluation and Creative problem solving integrated into a single process.

2. The Organizations Involved

World Friends Korea (WFK) is a Korean organization that comprehensively supports global volunteer and cooperation activities, and enables Korean organizations to transfer knowledge, skills, and technology to their partner countries as part of their international cooperation initiatives. As South Korea's top IT authority, the National Information Society Agency of South Korea (NIA) assists in digital education and endeavors to enhance technology-based international cooperation with their partner countries by strengthening digital capabilities. KAIST (Korea Advanced Institute of Science and Technology), a world top-tier university with strong emphasis on science technology education and research, joined as a key training partner to deliver high quality and technically advanced content. For UITS, the Institutional Quality Assurance Centre of UITS, which has been active in quality management, had an important role as a central organizer, assembling students and managing training in line with university's criteria for quality.

3. KAIST Student Volunteer Team

A group of KAIST student volunteers provided technical assistance to the training. The student team members came from a few academic departments:

- Jinhwa Kim — Bio & Brain Engineering
- Hyunji Huh — Industrial Design & School of Computing
- Heesang Shin — Material Science Engineering & Mechanical Engineering
- Michae Jung — Electrical Engineering

4. Purpose and Objectives of the Training Program

The WFK IT Online Training Program's goals, though varied, came together to ensure students emerged from the program ready for a career in today's tech world, as opposed to only having received snippets of knowledge:

1. Deepening their understanding of newer technology stacks.
2. Enhancement of your Python programming skills.
3. An Introduction to Artificial Intelligence and Machine Learning.
4. Introduction to the world of Vibe Coding & Modern Software Development-using-AI.
5. Empower students to construct tangible, working projects from start-to-finish.
6. Foster Collaboration and communication skills.
7. Encourage creativity and inventiveness.
8. Offer unique global learning opportunities where you can interact with KAIST student cohort.
9. Foster cross-cultural understanding and goodwill between Bangladesh and South Korea.
10. Equip students to face a future that the tech industry never stops rewriting

5. Overview of the Topics and Activities Covered

We touched on a great variety of technical material delivered incrementally during the three weeks. We went from Artificial Intelligence, to Machine Learning, on to Python, then Vibe Coding and modern AI-powered Software development but there was also space to have a higher-level conversation about exciting new digital tools & and how we will put these to use in software development.

I want to be specific about how far I was exposed to these. The aim over the 3-week course was not the deep mastery of each individual topic, but to go through the stages of introduction, comprehension and then assisted practice. For myself on the course, for the range of these topics, I can characterize myself as the following: the basic ideas of each were introduced to me, then I gained a working comprehension of their practical application, then I practiced direct application, via homework and the final project – as opposed to a deeper technical mastery of

the material, which is something I expect and hope to further developing my ongoing study and career path.

6. Knowledge and Skills Gained from Artificial Intelligence and Machine Learning

Learning that these are practical technologies for solving problems using data, algorithms, and computing machines, not academic or abstract fields, was helpful. Understanding data-driven problem solving, intelligent machines, automation, pattern recognition and prediction, and an AI based applications in conjunction with software products became more real.

Prior to this program, my "knowledge" of AI/ML was mainly textbook-driven, where emphasis is put on theory, math and algorithmic base. The WFK training illustrated the practical value of AI/ML beyond these base areas - the extent in which AI/ML are utilized to help build usable tools and have it integrated into the general software development process rather than something separate.

7. Learning About Vibe Coding and AI-Assisted Software Development

Some of the most profound new concepts within the program was Vibe Coding-a programming method whereby developers are partners with AI and code generation, modification, exploration and optimization. The idea of 'Vibe Coding' fundamentally altered the way that I see the prospect of writing software.

1. The quality of my prompts for AI tools I was using
2. Articulating my requirements such that they yielded usable, pertinent output
3. Critically examining generated AI code and not blindly trusting it
4. Debugging and adapting generated AI code for real-world usage
5. Employing an iterative approach (building a solution layer by layer rather than doing all at once)
6. Prototyping much quicker, thus leaving more time for the testing phase
7. Experimenting a lot more, since the risk associated in trying an idea out became lower
8. Adopting a more creative, divergent strategy towards problem solving

8. Assignment and Practical Learning Experience

Instead of a format based exclusively on lectures, the program of work, through a set of practical tasks and activities, merged a strong academic, technical, cultural, teamwork aspect and other transversal axes.

8.1 K-Culture Activities

There were also Korean Cultural activities, like DDakji, K-POP and Korean reels/memes. However, beyond their entertaining purpose, these activities were a great chance for students to experience Korean culture through these informality and low expectations to the Korean culture, which goes along with technical part of the program, and also created a bonding between UITS students and the volunteer team from

8.2 Individual Portfolio Assignment: Self-Introduction Website

All participants must complete the assignment for individual introduction /self-Introduction page website to learn several applied skills namely introduction to basic of web development, concept of structure content, concept of first touch of personal brand, to think about interface and user experience of a page, and idea to show who you are in a webpage.

8.3 Team Assignment:

Team member

- Farhan Nadim (0432310005101001)
- Md. Mefazur Rahman (0432310005101035)
- Md. Shoyaif Rahman (0432310005101050)

Yutnori Game

Projects - Games Team - Yutnori Students worked in teams to implement a digital version of Yutnori (Korean board game). This project had the potential to enable students to apply game logic and coding, foster extensive team and interpersonal work, foster the use and exploration of a different culture through one of its games, and provide early exposure to principles of interactive design.

Bangladesh Traditional Game Submission

As another component of the workshop, students were challenged to create or document a traditional Bangladeshi game, reversing the direction of cultural exchange and tasking the students to link technology with their own local culture. The game exercise prompted students to take pride in their identity as Bangladeshis, utilize a great deal of creativity to transform their traditional idea to its technology equivalent (digital game or documented game), document well (game instructions, history/meaning of the game), and acted as a true cultural exchange.

Interaction Room / Build Your Own Interaction Room

My final group project allowed me to develop an interactive space that was titled 'The Interaction Room'. This task taught me the importance of user interaction and interface design, a task that required imagination on how an interaction system should act and the necessity of both collaboration and practical application to make the concept feasible.

Final Project Experience

For my own learning, I felt the Final Project was by far the most significant part of the course. The main requirement was for a team to create a working application that met a real need from a teammate—an application relating to campus, commute, or neighborhood, and something the team or its friends would genuinely like to be fixed. A working feature must be implemented, and the solution could either be web- or mobile-based.

This was not typical schoolwork, where an assignment will normally dictate both the problem and how we have to try to fix it. My group instead had to ourselves identify a real problem, understand what the users to a new feature would require of them, come up with and then refine a solution idea, define a practical approach to fix it, design the application, implement at least one feature and then be sure to make it work as much as possible while also working effectively together as a team and testing it, before pitching the whole product. This helped teach us what the true software lifecycle was like, if only in a scaled down, actual version, that reinforced the knowledge gained throughout this academic part of this lesson through an actual assignment and a deadline.

9.Teamwork, Communication, and Soft Skills

On top of the technical training the WFK program equipped me with various soft skills which I believe are just as crucial as the technical ones.

- 1. Teamwork** – team work skills like delegating, openly sharing and exchanging information and ideas, conflicts management in an assertive but constructive way and a unified objective.
- 2. Communication** – given the context of an international team working online I've practiced in the necessity to communicate with my mentor and peers both in a very clear way but also being very specific, especially for the matter of cultural and time differences.
- 3. Problem Solving** – almost all the assignments required a more practical approach moving from a theoretical concept to the creation of a working application and not simply an empty paper solution.

4. Creativity – both team members had to come up with new project concepts and to implement it with some smart approach within tight constraints of time.

5. Adaptability – my exposure to AI in software development helped me realize the importance of constantly updating my skills.

6. Presentation – the final presentation of the team project helped me develop the capacity to clearly explain the functionality of a given product, and some underlying principles to an audience (even with less technical skills than myself).

7. Time Management – due to the format of 3 weeks intensive program, managing the learning part together with building my part in the team project, helped me improve prioritization.

One of the biggest takeaways was understanding that technical skills don't carry a real-world project through the end. Communication, agility, and strict time management is almost as important, and the WFK program's framework ensures you never get away with NOT learning the lesson.

10. Cultural Learning and Bangladesh–South Korea Exchange

Not only technical knowledge was the focus during WFK training. Through various kinds of cultural elements including DDakji, Yutnori, K-POP, Korean reels and memes, and physical interactions with KAIST students volunteers, culture immersion into the training was also provided to participants. By participating training, I can tell that there are several elements that are key principles of the training's organization and realization. Those are the ones namely discipline, teamwork, precision, cooperative work, invention and innovative efforts as mentioned in the slogan of the program itself 'together for a better future'.

Also, this program not only introduce Korea to Bangladesh but to also share Bangladesh to the rest of participant of the training. The Bangladeshi Traditional Game assignment opportunity provided the participant from UITS an interactive part of presenting Bangladeshi traditional games to KAIST members; thus, creating a bilateral exchange not merely a multilateral introduction to Korean culture. Direct social interaction between students of Korea and Bangladesh in the small space and scope of three week's period of training creates an international study environment that, I think, difficult to be created within just study in the classrooms.

11. Closing Ceremony and Overall Significance

The program culminated with a closing ceremony which took place on Monday, August 3, 2026 in the Conference Room of UITS. The event featured some distinguished personnel of the

university as Professor Dr. Md. Abu Hashan Bhuiyan, Vice-Chancellor of UITS graced the ceremony as Chief Guest. Professor Dr. Siraj Uddin Ahmed, Treasurer of UITS attended as Special Guest while Engr. Md. Safaet Hossain, Director of IQAC, UITS was the moderator. Mohammad Kamrul Hasan, Registrar, UITS and Mr. Al-Imtiaz, Associate Professor and Head, Department of CSE also addressed the participants as guests. The certificate was distributed among all the 72 participants by the guests.

While the ceremony itself was a fairly formal, concise affair, what it symbolized was so much more: the successful conclusion of a challenging three-week experience that mingled rigorous technical training with extensive teamwork, cultural exchange, and the implementation of an authentic final project. The certificate on display at the closing, marked the finish of the project - but what was gained in skills, habits and perspective over the past three weeks was certainly the bigger reward.

12. Conclusion

The 2026 World Friends Korea IT Online Training Program was a beneficial mix of technology, active learning, teamwork, invention, culture, and worldwide cooperation. Reflecting over the three weeks, the main lesson I'm able to take away is not a technology that I discovered how to build or manipulate, rather the learning process itself: how to learn, adapt, coordinate and employ innovative technology in order to find actual solutions. The experience allowed my current Computer Science and Engineering training for software development and a software engineering career ahead of me to appear a more concrete vision that includes communication, flexibility and collaboration in a team. Following our training programs guideline: I have incorporated its main message as my primary academic ambition as I proceed forward.
